

Sales Review

Al Rahma Trading Co. · January – July 2026 · six branches

This report was produced by automated analysis of a customer-supplied file. Every figure is traceable to that file. Analyses the supplied data could not support are listed as unavailable rather than estimated.

IN THIS REVIEW	
1. Summary	6. Discounts and returns
2. Sales performance	7. Branch performance
3. Period comparison	8. Concentration
4. Growth drivers	9. What this review does not cover
5. Profitability	

1 Summary

Revenue grew for the fourth consecutive month, but the growth came **entirely from higher prices rather than from selling more**. Units sold fell 2.1% while revenue rose 4.7%. Gross margin slipped from 31.4% to 30.6% because cost per unit rose faster than price. Three of six branches produce 71% of all sales.

▲ 9.2%

WHAT THIS MEANS

You are holding revenue up with price, not demand. That works while customers accept the increases — but units, discounts and returns are all moving the wrong way at the same time, which is the pattern that usually appears one or two periods before price resistance shows up in revenue.

2 Sales performance

Revenue rose in every month except April. July was the strongest month of the period at 403,000 EGP — but it was also the month with the fewest units sold, at 6,550.

Revenue and units sold, month by month. Both are drawn on one plot band so the divergence is visible; the axis is labelled in revenue, and unit figures are labelled directly on their own line.

■ Revenue (EGP) ■ Units sold

THE TURN HAPPENED IN MAY

Until April, revenue and units moved together. From May they separate: revenue keeps climbing while units fall. Everything after that point is price doing the work.

MONTH	REVENUE	UNITS	SALES	AVG SALE	AVG PRICE	GROSS MARGIN
January	318,000	6,980	2,110	151	45.6	31.6%
February	331,000	7,120	2,180	152	46.5	31.5%
March	356,000	7,240	2,260	158	49.2	31.4%
April	344,000	6,810	2,140	161	50.5	31.0%
May	372,000	6,890	2,230	167	54.0	30.4%
June	388,000	6,720	2,250	172	57.7	29.9%
July	403,000	6,550	2,034	198	61.5	29.4%
Period	2,512,000	48,310	15,204	165	52.0	30.6%

Revenue, average sale and average price in Egyptian pounds.

3 Period comparison

Against the seven months immediately before this period. Six of the eight figures moved in your favour; the two that did not are the two that decide profit.

FIGURE	THIS PERIOD	PREVIOUS	CHANGE
Revenue	2,512,000	2,399,000	▲ 4.7% good
Units sold	48,310	49,347	▼ 2.1% watch
Number of sales	15,204	15,083	▲ 0.8% good
Average sale value	165	159	▲ 3.9% good
Average selling price	52.0	48.6	▲ 6.9% good
Cost of goods sold	1,743,300	1,645,700	▲ 5.9% watch
Gross profit	768,700	753,300	▲ 2.1% good
Gross margin	30.6%	31.4%	▼ 0.8pp act

THE ONE LINE TO ACT ON

Cost of goods sold rose 5.9% while revenue rose 4.7%. Cost is growing faster than revenue, which is the whole of the margin decline. Price rises of 6.9% were not enough to cover it.

4 Growth drivers

Revenue rose 113,000 EGP. Splitting that change shows where it came from: higher prices added 164,000 EGP, while selling fewer units gave back 51,000 EGP.

What drove the revenue change, in Egyptian pounds. The two effects add exactly to the net change — when they do not, this analysis is withheld rather than shown.

READ THIS WITH SECTION 5

A 164,000 EGP price gain that yields only 15,400 EGP of extra gross profit means most of the price increase went to covering cost, not to margin. The growth is real; it is just not profitable growth.

5 Profitability

Gross profit rose 15,400 EGP on a revenue rise of 113,000 EGP — a 13.6% conversion. Margin fell every single month of the period.

Gross margin by month. Every month is lower than the one before it.

FIGURE	THIS PERIOD	PREVIOUS	CHANGE
Revenue	2,512,000	2,399,000	+113,000
Cost of goods sold	1,743,300	1,645,700	+97,600
Gross profit	768,700	753,300	+15,400
Gross margin	30.6%	31.4%	-0.8pp

6 Discounts and returns

Both rose faster than revenue. Together they cost 209,200 EGP this period, up 32,000 EGP.

DISCOUNTS GIVEN	RETURNS	COMBINED LEAKAGE
147,300 EGP	61,900 EGP	209,200 EGP
▲ 18.4% · 5.9% of revenue	▲ 9.2% · 2.5% of revenue	8.3% of revenue, was 7.4%

DISCOUNTING IS RISING ALONGSIDE PRICES

List prices rose 6.9% and discounts rose 18.4% in the same period. That combination usually means the price increase is being negotiated away at the counter — the increase is on the shelf but not in the till. Returns rising 9.2% points the same way.

7 Branch performance

Six branches. Two grew faster than the business; two shrank. Nasr City alone is 29.5% of revenue.

BRANCH	REVENUE	SHARE	CHANGE	UNITS	AVG SALE	MARGIN
Nasr City	742,000	29.5%	▲ 8.1%	13,910	178	31.8%
Maadi	618,000	24.6%	▲ 6.4%	11,760	171	31.1%
Heliopolis	424,000	16.9%	▲ 3.2%	8,240	163	30.4%
Giza	311,000	12.4%	▲ 1.1%	6,180	154	29.8%
Zamalek	228,000	9.1%	▼ 2.4%	4,610	149	28.9%
Dokki	189,000	7.5%	▼ 5.7%	3,610	143	27.6%
All branches	2,512,000	100%	▲ 4.7%	48,310	165	30.6%

MARGIN FOLLOWS SIZE, IN ORDER

The branches rank identically by revenue and by margin — Nasr City is both the biggest and the most profitable, Dokki both the smallest and the least, with no exceptions in between. Your two shrinking branches are also your two thinnest. Whatever Nasr City and Maadi are doing is worth understanding before Dokki gets more support.

8 Concentration

Sales are heavily concentrated. The top three branches of six produce 71% of revenue — if sales were spread evenly, three of six would produce 50%.

Cumulative share of sales. The shaded gap between your curve and the dashed line is how concentrated the business is — the wider the gap, the more it depends on a few branches.

■ Your sales ■ Even spread (reference)

CONCENTRATION RISK

Losing Nasr City would remove 29.5% of revenue and a disproportionate share of profit, since it also carries the highest margin. Concentration is not automatically bad — it often means one location is genuinely excellent — but it does mean the business has one point of failure rather than six.

9 What this review does not cover

Two analyses could not be produced from the file you supplied. Everything above is unaffected by these.

Basket size — how many items are in each sale

Your file has no receipt or invoice number, so there is no way to tell which rows belong to the same sale. Counting rows instead would overstate basket size wherever one sale spans several lines.

The rest of this review is unaffected.

To make it available: export with the receipt number included.

Comparison with the same period last year

Your file covers seven months, so the same period one year earlier is not inside it. The comparison in section 3 is against the seven months immediately before.

The rest of this review is unaffected.

To make it available: export a file that also covers January to July of last year.

Qualifications on figures that are shown

The concentration curve is drawn from 100 evenly spaced points across your full product range. The figures beside it use every row.

ملخص التقرير

ارتفعت الإيرادات للشهر الرابع على التوالي، لكن النمو جاء بالكامل من ارتفاع الأسعار وليس من زيادة الكميات المباعة. انخفضت الوحدات المباعة بنسبة 2.1% في حين ارتفعت الإيرادات بنسبة 4.7%.

وتراجع هامش الربح الإجمالي من 31.4% إلى 30.6%، لأن تكلفة المبيعات ارتفعت بنسبة 5.9% وهي أسرع من ارتفاع الإيرادات. كما ارتفعت الخصومات الممنوحة بنسبة 18.4% والمرتجعات بنسبة 9.2%، وهو ما يشير إلى أن الزيادة السعرية يجري التنازل عن جزء منها عند البيع.

وتستأثر ثلاثة فروع من ستة بنسبة 71% من إجمالي المبيعات، ويأتي فرع مدينة نصر وحده بنسبة 29.5%. ويتطابق ترتيب الفروع حسب الإيرادات مع ترتيبها حسب هامش الربح دون استثناء.

تحليلان لم يتسنّ إنتاجهما من الملف المُقدّم: حجم سلة الشراء — لعدم وجود رقم إيصال — والمقارنة بنفس الفترة من العام الماضي. وما عدا ذلك في هذا التقرير غير متأثر بهما.

Technical Evidence

Al Rahma Trading Co. · Report reference 4A7C-2F91 · version 2

How to read this page. Everything below is the governed machinery behind the business report: the internal identifier for each figure, the fact it cites, the raw reason code for each refusal, and the versions of every formula used. A reader checking or disputing a figure starts here. Nothing on this page is needed to read the report itself.

This layer is optional to the customer. It is generated for every report — always, unconditionally — and delivered only when asked for. In the shipped product it is a **separate page** in HTML, an **appendix** after a page break in PDF, and the **last two worksheets** in Excel. It appears below the report here only so the sample is a single file.
